

# Idaho Center for Plant and Soil Health, Parma

The new Idaho Center for Plant and Soil Health will be located on the Parma Research and Extension Campus. The campus serves the University of Idaho as a central hub for research, teaching, and outreach conducted by the U of I College of Agricultural and Life Sciences (CALs) in the Treasure Valley and was established in 1922. The new building will replace outdated existing facilities that were constructed over 50 years ago. The new 9,600 sq ft facility will equip the faculty to identify and address grower concerns and issues facing industry, provide an opportunity to increase research space and create an environment to better recruit and retain world-class faculty who will preserve the strength of the research conducted at the Center. The new building will contain dedicated laboratory space for research related to nematology, pomology, plant pathology, microbiology, and hops quality.

The design team consists of Anderson Mason Dale Architects of Denver, Colorado and Castellaw Kom Architects of Lewiston.
